

FynnChat on n8n

Four workflows, 67 nodes, built on our self-hosted n8n to match your brief. Every workflow is complete; none has credentials attached and none has been run against live accounts yet.

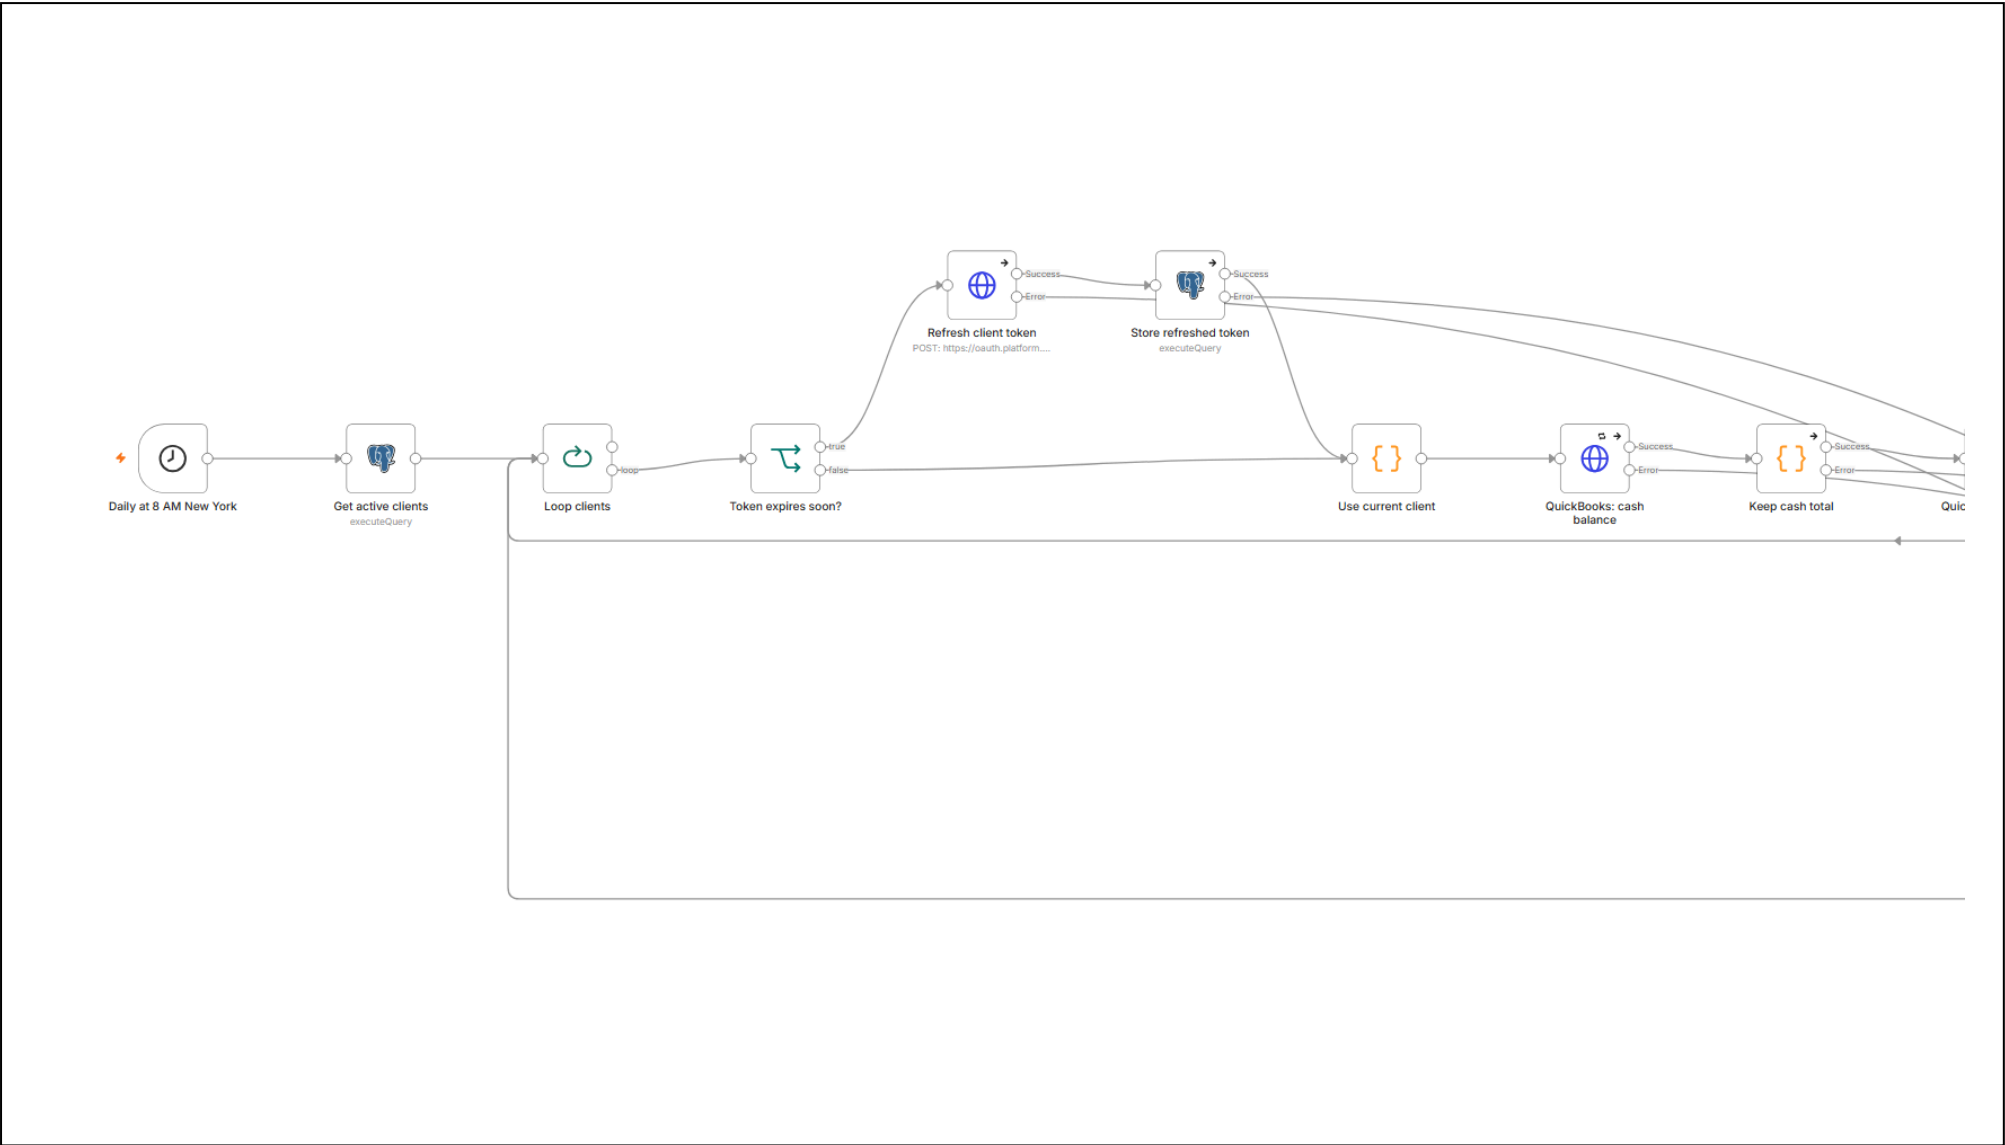

Built	Still needed
1. Daily Pulse 2. Urgent Alerts 3. QuickBooks Connect (OAuth 2.0) 4. Bookkeeper Dashboard	1. Your QuickBooks, Twilio, OpenAI and PostgreSQL credentials 2. Test run with two real client companies 3. Meta approval of the two WhatsApp templates 4. Deployment on your DigitalOcean server

- 1. Daily Pulse
- 2. Urgent Alerts
- 3. QuickBooks Connect (OAuth 2.0)
- 4. Bookkeeper Dashboard

- 2. Test run with two real client companies
- 3. Meta approval of the two WhatsApp templates
- 4. Deployment on your DigitalOcean server

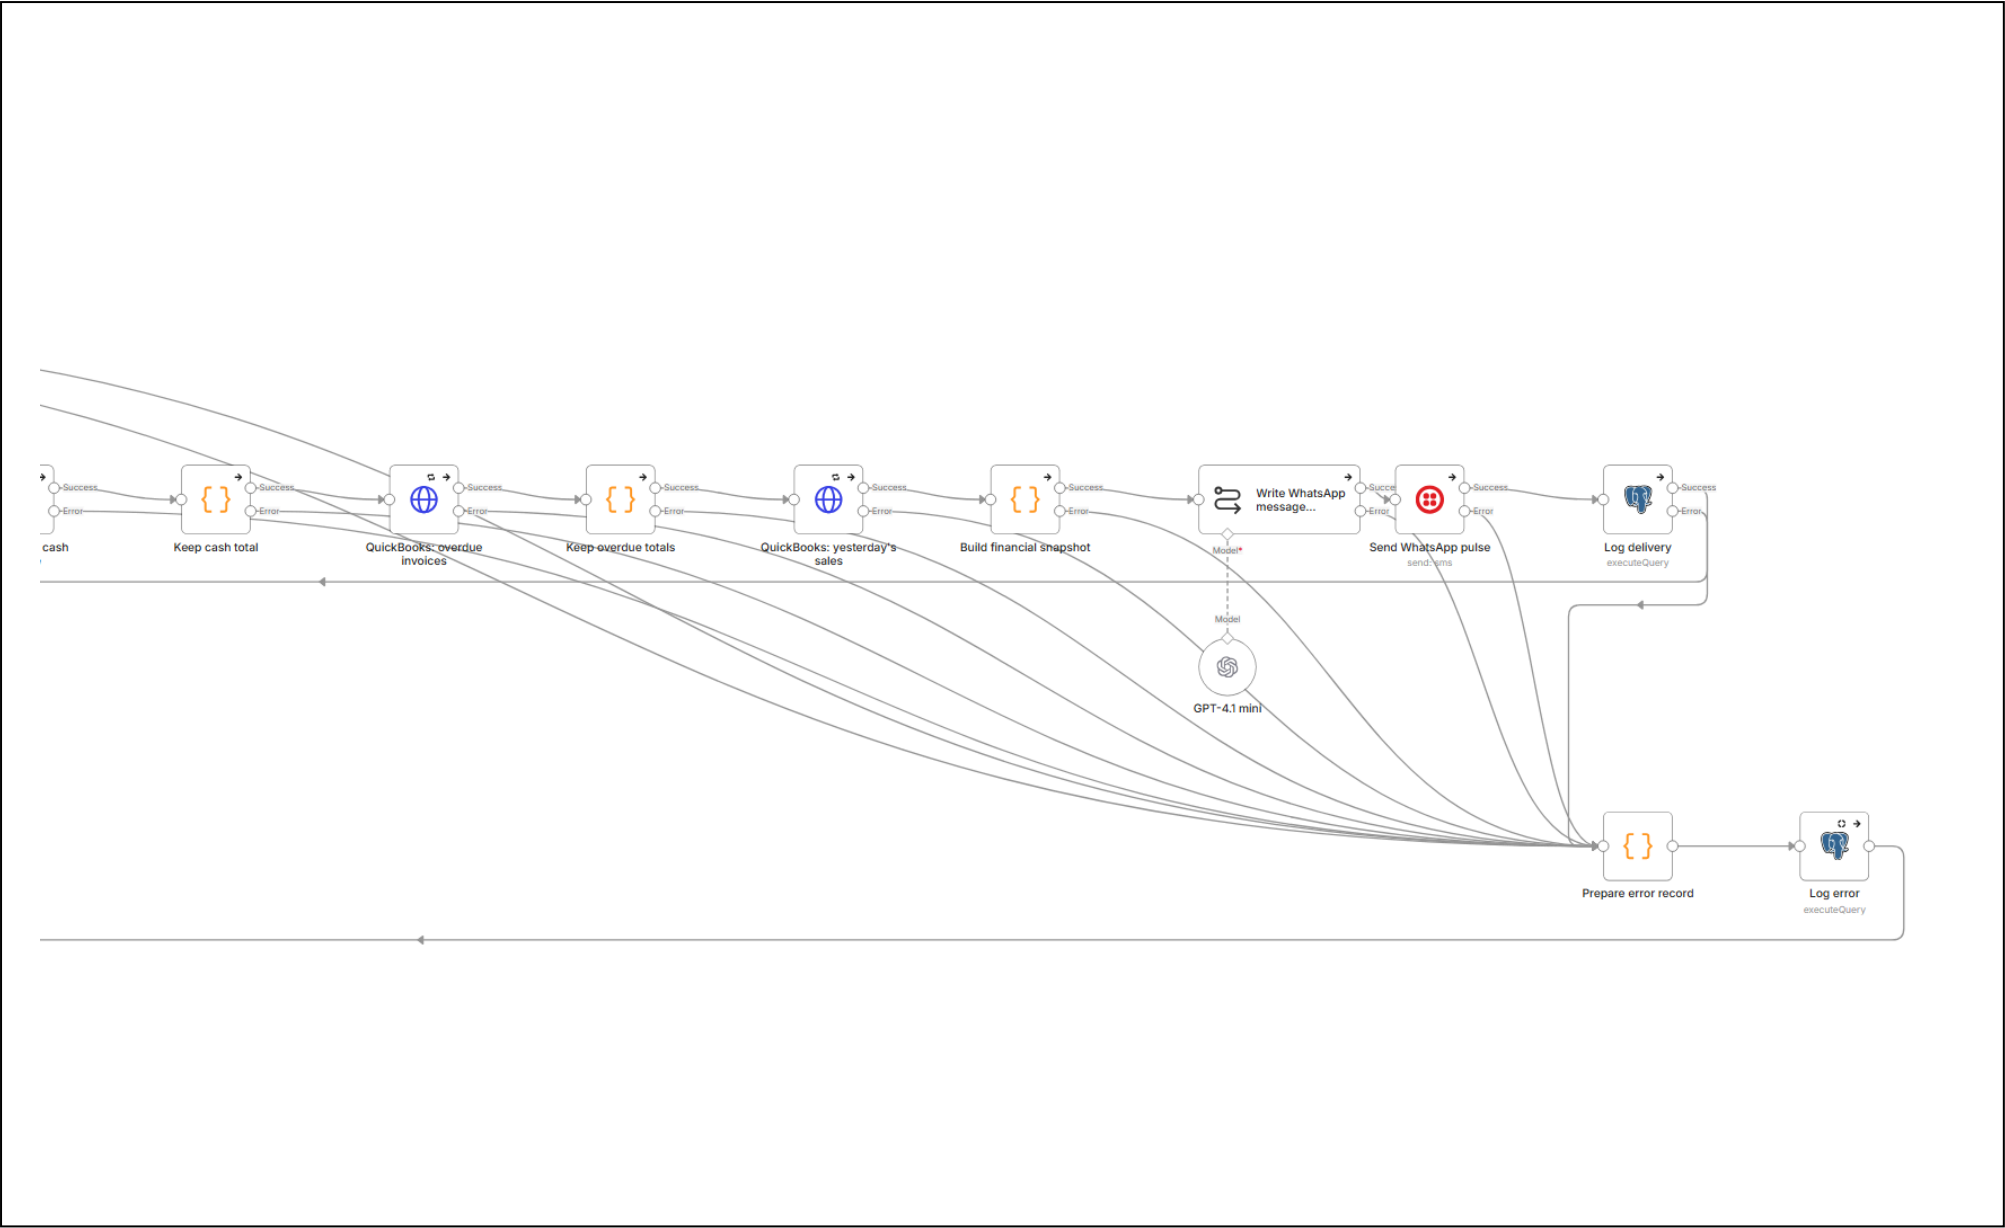

Daily Pulse · 8 AM New York (1/2)

Loops through active clients, pulls cash, overdue invoices and yesterday's sales from QuickBooks, writes the message in English or Spanish with GPT-4.1 mini, sends it on WhatsApp and logs every delivery. Expiring tokens are refreshed first; a failed client is logged and the loop continues.

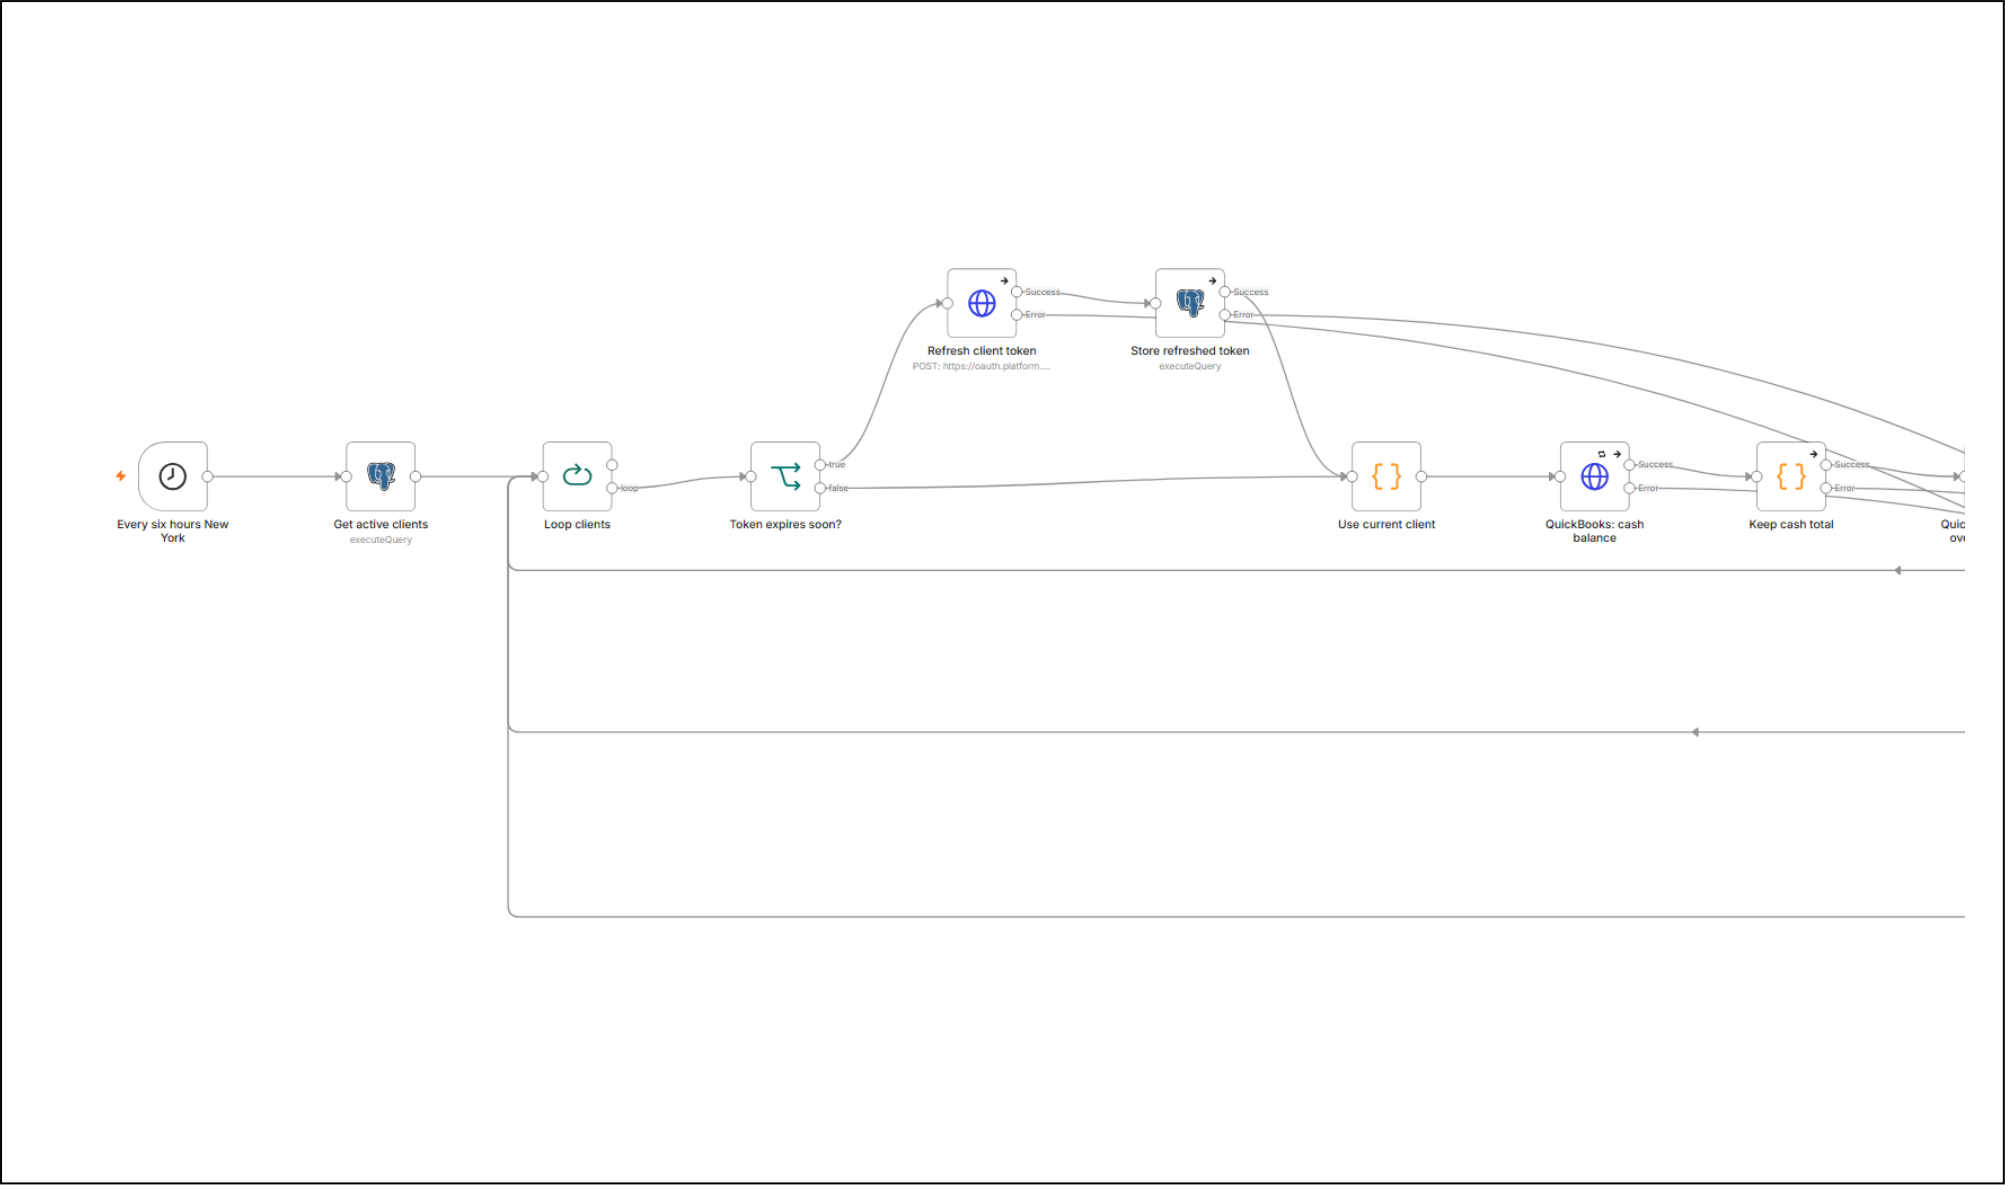

Daily Pulse · 8 AM New York (2/2)

Right half: QuickBooks pulls, GPT message, WhatsApp send, delivery log and the shared error log.

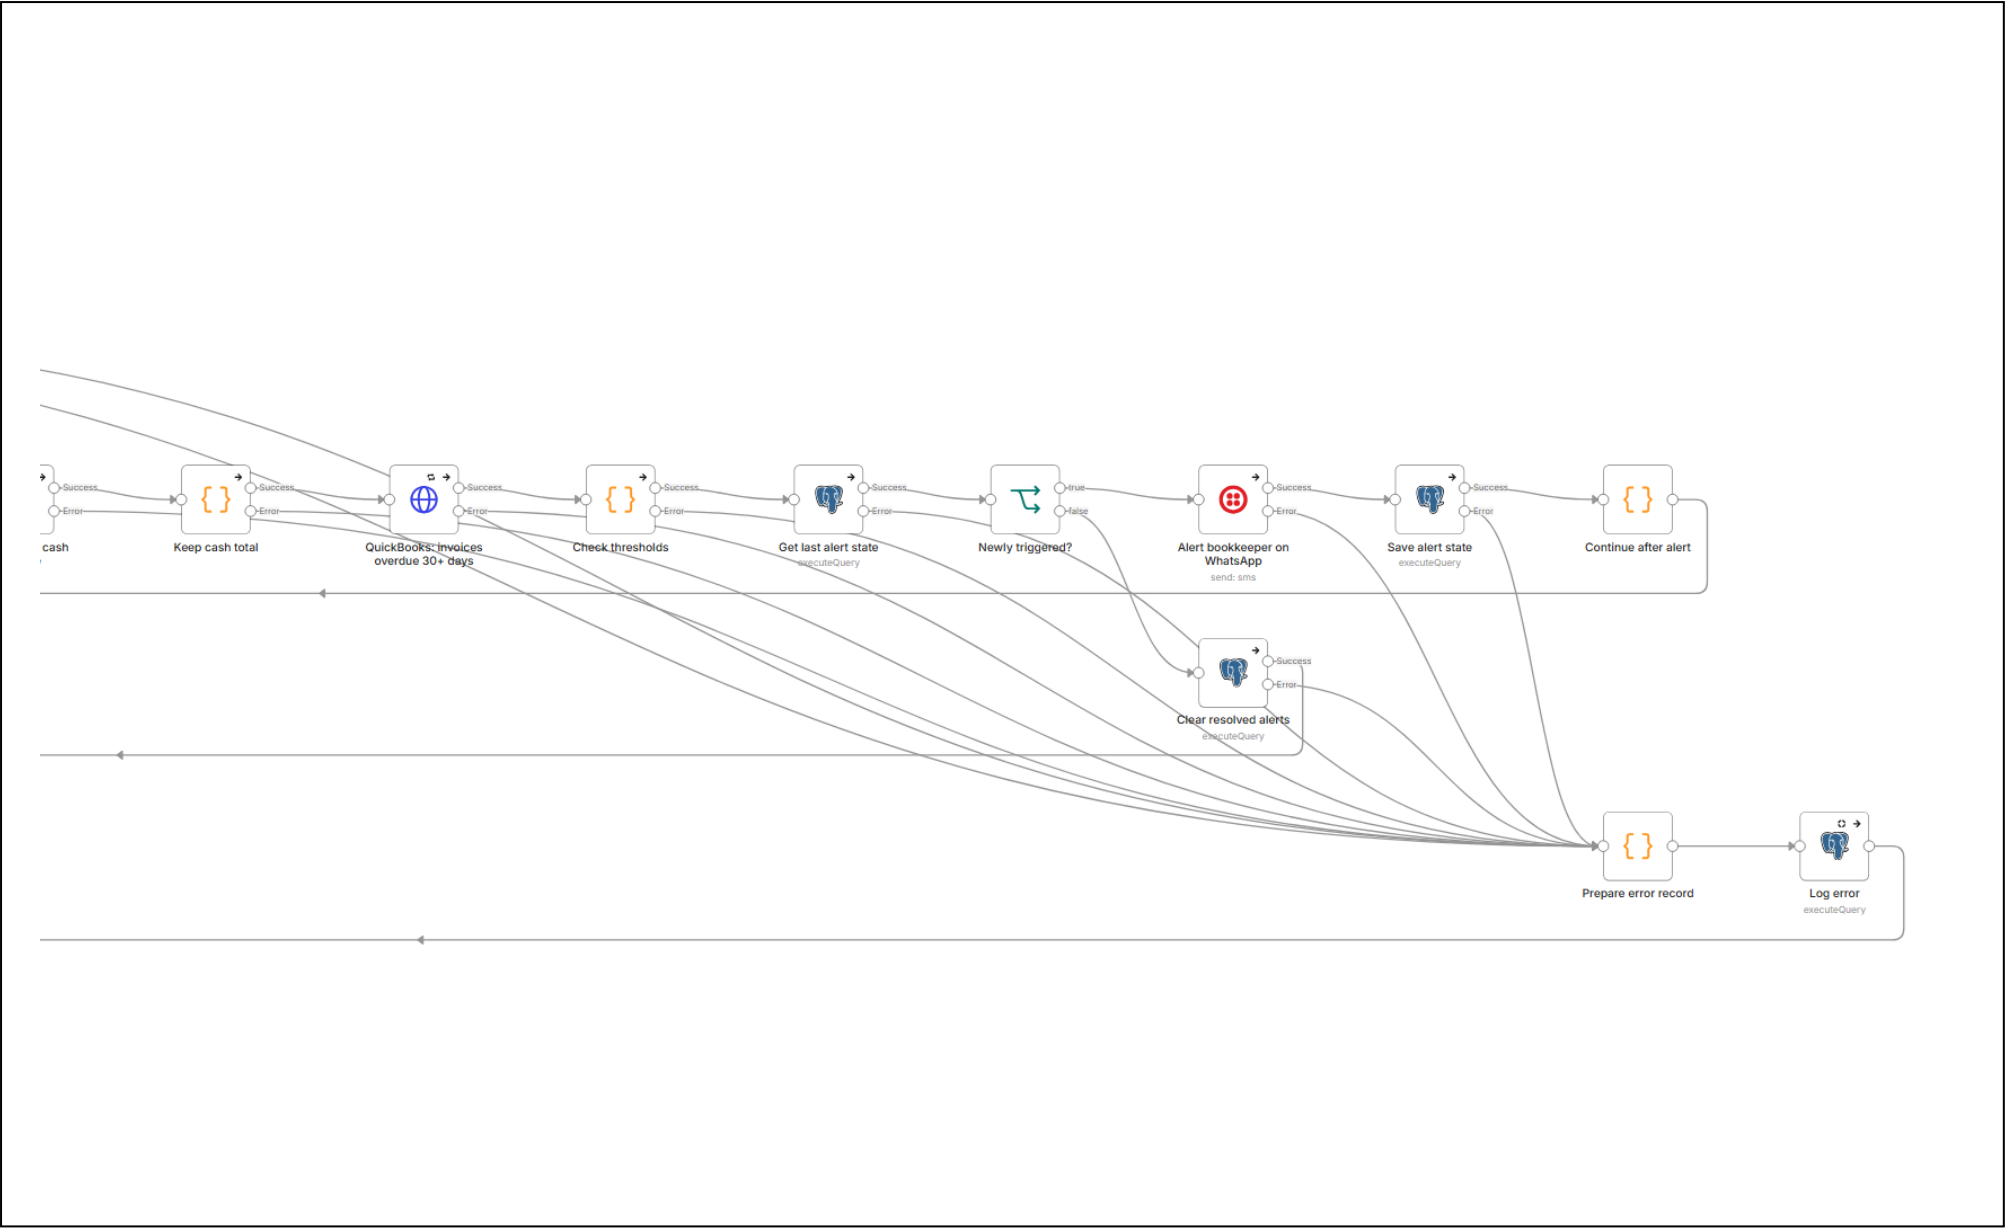

Urgent Alerts · every 6 hours (1/2)

Checks cash below \$2,000 and invoices more than 30 days overdue. Alerts the bookkeeper on WhatsApp only when a condition is newly triggered, and clears resolved alerts so they can fire again later.

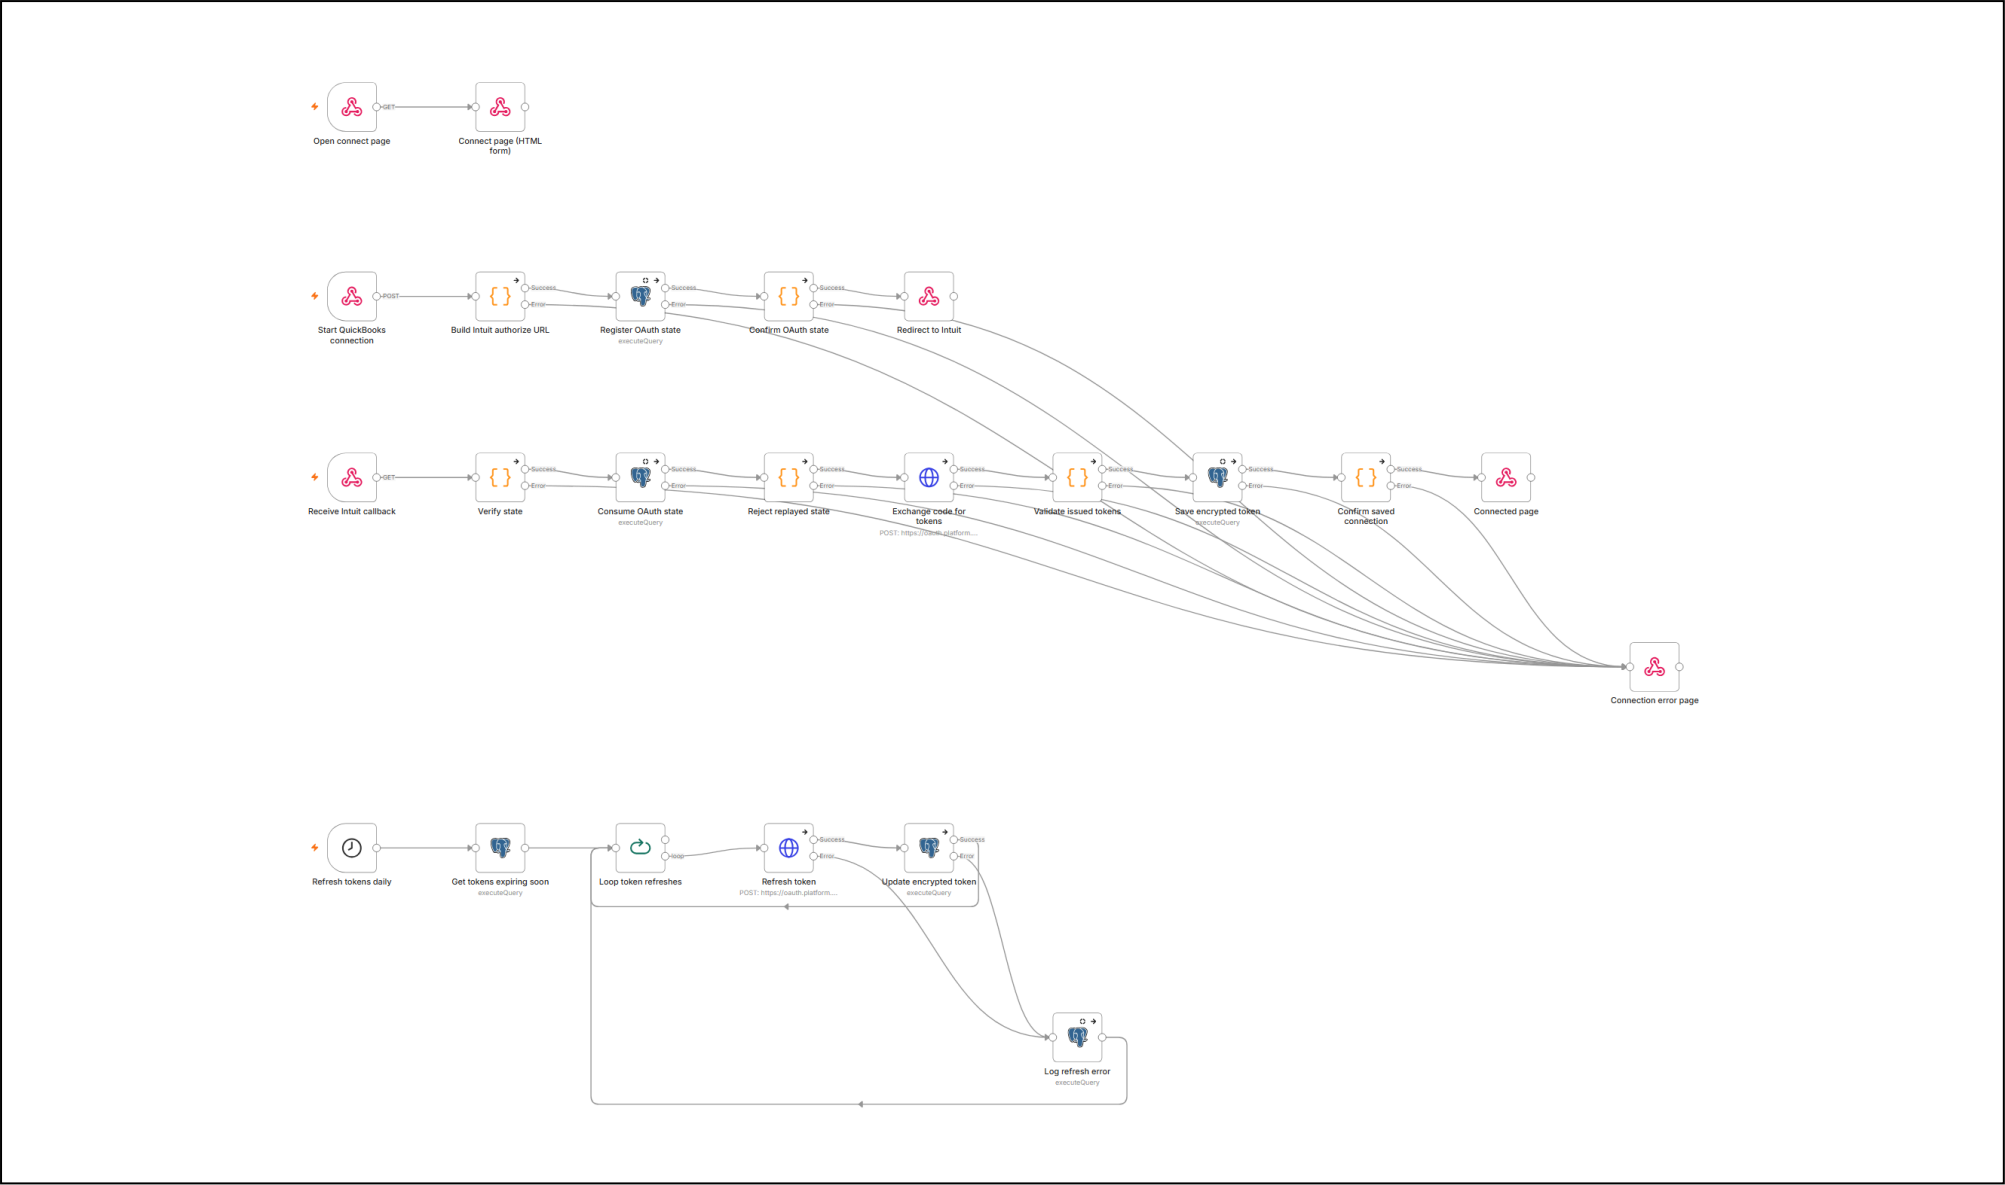

Urgent Alerts · every 6 hours (2/2)

Right half: threshold check, newly-triggered test, bookkeeper alert, alert state and the shared error log.

QuickBooks Connect · OAuth 2.0

The /connect page and Intuit OAuth flow with a signed, single-use state (replay protection), token exchange and validation, tokens saved encrypted in PostgreSQL, and a daily token refresh with error logging.

Bookkeeper Dashboard

Login-protected /dashboard. Each bookkeeper sees only their own clients: cash today, overdue invoices, last message sent and delivery status.
